                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 1: Page 115-116; 141pp; English.

This sequence is encoded by a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent this protein sequence). An antibody which binds to an immunogenic portion of a prostate protein (such as this protein sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              human prostate specific tumour protein and fragments - useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Prostate tumour specific gene clone DE13 protein.

                                                                                                                                             Polypeptides comprising immunogenic portions of prostate proteins - used in a vaccine for the treatment of prostate cancer Example 3; page 107-108; 130pp; English.

The present sequence is an immunogenic portion of a prostate tumour protein. The immunogen, or the DNA encoding it, can be used as a vaccine for the treatment of prostate cancer. The immunogen was isolated from a prostate tumour CDNA library obtained by subtracting a prostate tumour cDNA library with a normal tissue cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                502

This represents a human prostate-specific kallikrein (HPSK). A host cell rootaining an expression vector comprising the HPSK nucleic acid sequence containing an expression vector comprising the HPSK nucleic acid sequence can be used to produce the protein recombinantly. The HPSK products can be used for the diagnosis of conditions or diseases associated with expression of HPSK such as prostate carcinoma and benign prostate hyperplasia. Agonists and antagonists which specifically bind to HPSK and modulate its activity can be used for the preparation of treatment of such conditions or diseases. The products can also be used for detection and drug screening, especially for the detection of prostate-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated prostate-specific kallikrein - used to develop products for diagnosis and treatment of, e.g. prostate carcinoma or benign
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 53 GCTGGGCCTGCACAGTCTTGAGGCCGACCAAGAGCCAGGGAGCCAGATGG 102

Example 1; Page 112-113; 141pp; English.

This sequence is encoded by a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as this protein sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor progression of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    il protein.

   Polypeptides comprising immunogenic portions of prostate proteins - used in a vaccine for the treatment of prostate cancer Example 3; Page 105; 130pp; English.

The present sequence is an immunogenic portion of a prostate tumour protein. The immunogen, or the DNA encoding it, can be used as a vaccine for the treatment of prostate cancer. The immunogen was isolated from a prostate tumour CDNA library obtained by subtracting a prostate tumour cDNA library with a normal tissue cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             08-DEC-1998 (first entry)

for detecting and treating prostate cancers
Example 1; Page 117-118; 141pp; English.
This sequence is encoded by a human prostate tumour specific gene, and
can be used in the method of the invention. The method is for detecting
prostate cancer comprises contacting a biological sample with an agent
able to bind an immunogenic portion of a prostate protein (such as
this protein sequence). An antibody which binds to an immunogenic
portion of the prostate protein, and the method can be used to detect,
monitor progression of, or treat prostate cancers. The antibody may
also be conjugated to a therapeutic agent for use in therapy of prostate
                                                                                                                                                                                                                                                                                                                                                                   Novel human prostate specific tumour protein and fragments - useful

Polypeptides comprising immunogenic portions of prostate proteins used in a vaccine for the treatment of prostate cancer. Example 3: Page 109; 130pp; English.

The present sequence is an immunogenic portion of a prostate tumour protein. The immunogen, or the DNA encoding it, can be used as a vaccine for the treatment of prostate cancer. The immunogen was isolated from a prostate tumour cDNA library obtained by subtracting a prostate tumour cDNA library obtained by subtracting a prostate tumour cDNA library with a normal tissue cDNA
                                                                                                                                                                                06-33N-1999 (first entry)
Protein encoded by prostate tumour clone P703 splice variant DE14.

Ne Introduction acids encoding human secreted proteins - obtained from CDNA libraries prepared from e.g. liver, ovary, brain, prostate, ting of washilacal cord, placenta and colon tissue claim 27; Page 661; 824pp; English.

X41094 to X41347 represent 5' expressed sequence tags (ESTS) for human secreted proteins, and encode the proteins given in Y12561 to Y12514, respectively. The proteins given represent the signal peptide and an vernalial fragment of a secreted human gene products. They can also be used for producing secreted human gene products. They can also be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins of the man activity, reproductive hormone regulating activity, chemoteractic/ activity, reproductive hormone regulating activity, chemoteractic/ chemokinetic activity, haemostatic and thrombolytic activity, receptor/ crother activity, haemostatic and thrombolytic activity, receptor/ crother activities. The products can be used in forensic, gene therapy and chromosome mapping promoter sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide or the insertion of a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; secreted protein. EST; expressed sequence tag; diagnosis; forensic; gene therapy; chromosome mapping; signal peptide; upstream regulatory sequence; cytokine activity; cell proliferation; differentiation; haematopoiesis regulation; tissue growth regulation; reproductive hormone regulation; chemotactic; chemokinetic; haemostatic; thrombolytic; anti-inflammatory; tumour inhibition.

                                                                                                                                                                                                                                                                                       anti:sense therapy
Claim 22; Page 171-172; 238pp; English.
Amethod for detecting the presence of neural thread protein (NTP)
having a molecular weight of 8, 14, 17, 21, 26 or 42 kD in a human
subject comprises (a) contacting a sample from a human subject that
is suspected of containing the NTP with at least one molecule
capable of binding to the protein; and (b) detecting any of the
molecule bound to the protein. The binding molecule is selected
from an antibody free of natural impurities, a monoclonal antibody
or a binding fragment of either of these. The method may be used for
tumnours and a malignant astrocytoma in a human.
                                                                                                                                                                                                                                                                                                                                                                                                         Neural thread protein; NTP; diagnosis; detection;
Alzheimer's disease; neuroectodermal tumour; malignant astrocytoma;
monoclonal antibody; binding fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection of neural thread protein in diagnosis of Alzheimer's disease – also NTP DNA and protein sequences used in gene and

Designation of the short form of the TPR This represents the amino acid sequence of the short form of the TPR This represents the amino acid sequence of the short form of the TPR motif Y (TPRY) gene product. The invention relates to genes occurring on the non-recombining region of the human Y chromosome. The sequences fall into two classes: (1) X-homologous DNA which are expressed in many organs, having functional X homologues and (2) testis-specific DNA sequences. Y chromosomal DNA from males with known conditions such as infertility and reduced sperm count can be assessed using the invention to determine whether the condition is associated with or caused by the occurrence of the gene or gene alteration. Candidate inhibitors of the enzymatic activity of the genes can be assessed using in vitro assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      02-FEB-1999 (first entry)
Short form of TPR motif Y (TPRY) gene product.
Short combining region; human; Y chromosome; X homologue; testis; TPRY; infertility; sperm; gene alteration; inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel genes in the non-combining region of Y chromosome – useful t
diagnose if male infertility or reduced sperm count has a genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1264 TCACCATTTTGGCCAGGCTGGTCTTGAACTCCTTACCTCAAGTGATCTGC 1215

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ပ္ပင္တ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human kallikrein polypeptide, HKALL - useful e.g. to treat skin disorders e.g. eczema, psoriasis and screen for antagonists useful polypeptides, and cancers

Claim 1; Page 41-42; Glpp; English
CC The present sequence represents human kallikrein, designated HKALL.
CC HKALL (or fragments) can be administered therapeutically to increase protecolysis and subsequent skin scaling to treat/prevent skin disorders, e.g. eczema, psoriasis and scleroderma. HKALL has chemical and structural homology with human stratum corneum chymotryptic enzyme (thought to be involved in the protecolysis of intercellular cohesive structures necessary for desquamation, the process by which outer layers of skin are eliminated), and its expression in CDNA libraries was associated with tumour associated tissues and skin cells. It can be used to suppress excessive protecolysis and conscient skin cell scaling, so may be administered to treat skin disorders. They may also be used to suppress excessive coll for HKALL can be used to suppress excessive call for HKALL can be used to suppress excessive call for HKALL can be used to suppress excessive call for HKALL can be used to suppress excessive call for HKALL can be used to suppress excessive to treat skin call scaling, so may be administered to treat/prevent cancer, e.g. denocarcinoma, leukaemia and melanoma. Antibodies specific for HKALL can be used to suppress excessive to the end of the end of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            by HRALL expression and to monitor therapeutic interventions. The polynucleotide encoding HRALL, or complementary sequences, can be used to produce hybridisation probes, useful to detect polynucleotides encoding HRALL, e.g. to diagnose diseases relating to polypeptide expression (e.g. cancers of the bladder, prostate) or monitor HRALL regulation during therapeutic intervention. Polynucleotides encoding HRALL are useful to produce antisense sequences for therapeutic administration to modulate/prevent HRALL expression e.g. to treat/prevent skin disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human kallikrein.

New isolated human genes and the secreted polypeptides they encode - useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders.

This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc to portion (e.g. X27302) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 123 novel genes and their fragments (nucleic acid sequences: X27311.x27449; amino acid sequences Y0250-Y02788) which are useful for preventing, treating or ameliorating medical conditions or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypucleotides.

Specific uses are described for each of the 123 polynucleotides, based on which tissues they are most highly expressed in (see X27311 for described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (HUMA-) HUMAN GENOME SCI INC.

Human breast cancer related genes - used for diagnosis, pre-symptomatic detection and therapy of breast and ovarian cancers of Calim 2; Fig 3e; 96pp; English.

The proteins encoded by human breast cancer related genes, L-oncogenes (V17738-V17753) can be used in the diagnosis and treatment of breast and ovarian cancer. Antibodies and multiple antigenic peptide epitopes can be used to detect the presence of the proteins. The antibodies can also be used to block the activity of the protein. Antisense molecules can bused to prevent expression of the proteins.
